

As this pilot study was predominantly descriptive in nature and not designed to test a specific hypothesis, no sample size calculation was performed. Comparison of the impact of a positive and negative FC test on a decision to change patient management and on the usefulness of the FC test was based on Fisher's exact test or Chi-square test as appropriate. McNemar Chi Square test was used to examine the change in the decision of performing a colonoscopy pre and post FC test. Statistical calculations were performed using GraphPad Prism (GraphPad Software Inc., USA) and Statistical Analysis (Version 9.4, USA) software. The statistical process was overseen by Dr Terry Lee, Centre for Health Evaluation and Outcome Sciences, St Paul's Hospital, Vancouver, British Columbia
