**Factors influencing baseline and change over 6 weeks in  
WEB-based IBS-SSS, IBS-QOL, IBDQ, SCCAI, HBI, FC, CRP and  
FODMAPS score:**

**Results based on 78 subjects in a controlled clinical trial**

The baseline IBS-SSS is considered a continuous dependent variable and is treated using a linear normal analysis of covariance (ANCOVA) with covariates: Treatment at baseline, Gender, Age35, Smoking status, UC/CD, Surgery before baseline, years since IBD diagnosis and BMI. Note that BMI is used as regression variable.

The baseline FODMAPS is considered a continuous dependent variable and is treated using a linear normal analysis of covariance (ANCOVA) with covariates: Treatment at baseline, Gender, Age35, Smoking status, UC/CD, Surgery before baseline, years since IBD diagnosis and BMI. Note that BMI is used as regression variable.

**Table17: Change from baseline in FODMAPS: analysis of COVARIANCE**

Effect	contrast	DIFF_FODMAPS	Lower	Upper	p_value
FODMAPS1	Per baseline FODMAPS point	-0.6627	-0.8791	-0.4462	<.0001

Treat BL	Immuno vs none	4.3215	-7.1506	15.7936	0.4536
Remission	No vs. Yes	3.1818	-7.2668	13.6305	0.5443

The change in FODMAPS is analyzed using the same model, EXCEPT for the inclusion of the baseline FODMAPS value as regression variable and the Treatment effect.
