

The guidelines for an observational study were followed and the necessary changes were made so that the manuscript has the recommended format.

The Method section was amended and body of the manuscript altered as suggested.

Paired figures were included for image 5. Preoperative radiographs of image 1 are not included as these radiographs were inserted to highlight the distal placement of the plate when compared to standard volar plates.

The scoring system was not included in the results, as the aim of the study was to evaluate whether anatomy can be restored and maintained until fracture union using this plate; and to highlight technical considerations when using this plate. Functional outcome was not an aim of the study, even though DASH scores were obtained as part of patient clinic follow up.
