

Dear Editor,

Thank you for your interest in considering a revised version of our manuscript. Please find enclosed the edited manuscript entitled “Unusual Gastric Tumors and Tumor-like Lesions: Radiological with Pathological Correlation and Literature Review” following the changes as suggested by reviewers. Point-by-point response to reviewers’ comments are listed below. The authors would like to thank all the editors and reviewers for careful review of our manuscript and providing us with their valuable comments and suggestions.

Reviewer 1 – code: 02542970

Comment to the Author

The abstract should be written in the form of AIM, METHOD, RESULT, CONCLUSION.

*Response:*

Thanks for your suggestion. According to the guideline and requirements for manuscript, we have revised the abstract as an informative, and unstructured abstract of no less than 200 words.

Reviewer 2 – code: 02346872

Comment to the Author

In this review article, the authors review the relevant literature and discuss the CT features and histopathologic findings of different types of gastric lesions. The lesions are divided into benign (glomus tumors, schwannomas, leiomyomas, and lipomas), malignant (gastrointestinal stromal tumors, mucinous carcinomas, lymphomas, and carcinoid tumors), and tumor-like lesions (ectopic pancreas and bezoar). Familiarity with the CT features of these diseases facilitates accurate diagnosis and further management.

*Response:*

Thanks for your comments.
