Postoperative deep shoulder infections following rotator cuff repair

Kivanc Atesok, Peter MacDonald, Jeff Leiter, Sheila McRae, Greg Stranges, Jason Old

Abstract

Rotator cuff repair (RCR) is one of the most commonly performed surgical procedures in orthopaedic surgery. The reported incidence of deep soft-tissue infections after RCR ranges between 0.3% and 1.9%. Deep shoulder infection after RCR appears uncommon, but the actual incidence may be higher as many cases may go unreported. Clinical presentation may include increasing shoulder pain and stiffness, high temperature, local erythema, swelling, warmth, and fibrinous exudate. Generalized fatigue and signs
