Biological ² mesh reconstruction of the pelvic floor following abdominoperineal excision for cancer: A review

Schiltz Boris, Buchs Nicolas Christian, Penna Marta, Scarpa Cosimo Riccardo, Liot Emilie, Morel Philippe, Ris Frederic

Abstract

Extralevator abdominoperineal excision (ELAPE) and pelvic exenteration (PE) are mutilating operations that leave wide perineal wounds. Such large wounds are prone to infection and perineal herniation, and their closure is a major concern to most surgeons. Different approaches to the perineal repair exist, varying from primary or mesh closure to myocutaneous flaps. Each technique has its own associated advantages and potential complications and the ideal approach is still debated.
