Lumen apposing metal stents for pancreatic fluid collections: Recognition and management of complications

Michael L DeSimone, Akwi W Asombang, Tyler M Berzin

Abstract

For patients recovering from acute pancreatitis, the development of a pancreatic fluid collection (PFC) predicts a more complex course of recovery, and introduces difficult management decisions with regard to when, whether, and how the collection should be drained. Most PFCs resolve spontaneously and drainage is indicated only in pseudocysts and walled-off pancreatic necrosis when the collections are causing symptoms and/or local complications such as biliary obstruction. Historical approaches

Lumen-apposing metal stents for pancreatic fluid collection drainage: may not be business as usual?

JS Leeds, MK Nayar, RM Charnley, [KW Oppong](#) - Gut, 2016 - gut.bmj.com

We read with interest the paper by Bang et al 1 concerning their interim analysis of an ongoing randomised study comparing a novel fully covered self-expanding metal stent (fcSEMS) to plastic stents in patients undergoing endoscopic drainage of walled-off pancreatic necrosis (WOPN). This was following concerns over higher than expected adverse events in the fcSEMS (50%) compared with the plastic stent group (0%). ...
