Total joint replacement in inhibitor-positive haemophilia: Long-term outcome analysis in fifteen patients

Danielson Heidi, Lassila Riitta, Ylinen Pekka, Yrjönen Timo

**Abstract**

**Aim:** To collect data from joint replacement in inhibitor patients, evaluate haemostatic and patient outcomes, and analyse the costs.

**Methods:** We report our 21-year, single-centre cumulative experience of 15 joint arthroplasties in six inhibitor patients.

**Results:** Two low responder inhibitor patients were in the early days treated with FVIII, whereas bypassing agents were used in the rest of the high responder patients. The primary haemostatic outcome was good in 8/15, fair in 4/15 and poor in 3/15 operations.

## Match Overview
