BRAF V600Q-mutated lung adenocarcinoma with duodenal metastasis and extreme leukocytosis

Ayman Qasrawi, Addison Tolentino, Mouhanna Abu Ghanimeh, Omar Abughanimeh, Sakher Albadarin

Abstract

14 Driver mutations in patients with non-small cell lung cancer can lead to distinct behaviors and patterns of metastasis. Mutations in the proto-oncogene B-raf (BRAF) occur in approximately 3% of 2 non-small cell lung cancer cases. In the literature, reports of patients with lung adenocarcinomas metastasizing to the duodenum are rare, and most of the only 21 cases reported were from before the advent of next-generation
