COMMENTS TO AUTHORS

This study is well designed, methodology and data collection are competent, the paper is well written in a clear language, however, i have the following comments: 1-The number of patients on whom genetic analysis was performed is small (36 only),and the authors compared their findings to similar studies in neighboring countries (total number of more than 500 subjects), so the authors can extend their genotyping work on more patients in Lebanon to reach solid conclusions. 2- This good study would be suitable for publication at a genetics journal particularly regional ones. 3- The clinical impact of this study on WD management is limited, therefore, many clinicians would not be so interested in this study.
