Gastric metastasis from ovarian adenocarcinoma presenting as a subepithelial tumor and diagnosed by endoscopic ultrasound-guided tissue acquisition

Filippo Antonini, Liboria Laterza, Lorenzo Fuccio, Massimo Marcellini, Lucia Angelelli, Sonia Calcina, Corrado Rubini, Giampiero Macarri

Abstract

We describe an uncommon case of a patient with a metastatic adenocarcinoma of ovarian origin presented as a gastric subepithelial tumor (SET) and that was diagnosed by endoscopic ultrasound fine-needle biopsy (EUS-FNB). Malignant gastric lesions are rarely metastatic and the primary tumor is mainly breast, lung, esophageal cancer or cutaneous melanoma. Gastric metastasis from ovarian cancer are unusual, presenting synchronous with the primary tumor but also several years later than initial diagnosis. From an endoscopic point of view, gastric metastasis do not present specific features. They may mimic both a primary gastric tumor or, less frequently, a SET. This case demonstrates the
