COMMENTS TO AUTHORS

The article is "densely" written but is a valuable contribution. In "summary of background data," change the "to" after "accepted" to "for"

COMMENTS TO AUTHORS

The authors have written a review of data gained from 35 different patients between 1-10 years of age with the goal to correlate the Pang and Lee class with the clinical course in a consecutive series of patients presenting with painful torticollis. The authors found a lack of correlation between the Pang type and the radiologist's interpretation suggests the need to work with our radiologic colleagues to define a common language. This review is well written and should be published as this reference can then be used to justify new methods of classification as this review indicates is needed.
