COMMENTS TO AUTHORS

In this retrospective study, Alobaidi et al investigate potential predictor variables of complications post-operatively in the PICU after liver transplantation in children age <3 years. They found surgeon was associated with complications, and whole liver graft and lower AT postoperative were associated with more early complications. This study is another one study about this topic that has been analyzed by other groups with variable results. Although this study has some limitations described by authors, and sample size is small/modest, results suggest a new potential risk factor for early complications in young children.

COMMENTS TO AUTHORS

The authors present an interesting retrospective study evaluating risk factors in children <3years with liver transplantation within 10 years in 65 children mostly with biliary atresia. Overall, the manuscript is written well, and should be recommended for publication in World Journal of Hepatology after minor corrections. The term surgeon should be explained better, including comments on the training and experience of the surgeons. More detailed comments on antithrombin would be interesting. Design of all figures should be optimized in a reader-friendly manner (letterings).
