COMMENTS TO AUTHORS

A very interesting and comprehensive review of hepatocyte transplantation so far. A comment on the success of islet cell transplants would be useful and how this might apply to hepatocytes. Is it just a volume of cells difference or is the autoislets cell transplantation the real secret to success, where immunosuppression is not an issue. A comment too on the potential role of genetic editing in the future would be useful

COMMENTS TO AUTHORS

In the manuscript entitled, “Hepatocyte transplantation: Consider infusion before incision”, Heath and co-workers summarize the current status of hepatocyte transplantation. One important aspect lacking in this review is how to prepare hepatocyte. Are there any advancements in hepatocyte isolation technology? Are there any changes in regulatory issues regarding manufacturing process? The authors may want to consider including these aspects in the manuscript. There are a few minor points that the authors should address. 1. There are so many errors in terms of usage of capital letter. For example, there is no need of capital “V” for vitamin D. 2. There are many unnecessary abbreviations.

COMMENTS TO AUTHORS

In this manuscript, the authors discuss hepatocyte transplantation predominantly for in born errors of metabolism. In most instances it acted as a bridge to liver transplantation. The main difficulty observed is the challenge of maintaining hepatocyte function long term. The article is written well. I have the following comments/critiques: 1. There should be some discussion or recommendation regarding type of immunosuppression needed in these patients. 2. Is there any data on hepatocyte transplantation in conditions such as primary hyperoxaluria?
