COMMENTS TO AUTHORS

Interesting case report about the use of gastrografin in cases of enteric anisakis. I want to remark several questions before its publication -The paragraph about in vitro study is little consistent: it's impossible to extract conclusions with 9 cases. I think this paragraph must be removed -Table 1 is useless; I'd remove it too -Case report description is right -At the end of the discussion, I'd modify the conclusion: "Consequently, we suggest that the Gastrografin administration therapy could be a safe, convenient, and useful method to extract enteric Anisakis larvae, although more studies are necessary to confirm our results

COMMENTS TO AUTHORS

Thank you for submitting an interesting case report regarding gastric and enteric anisakiasis successfully treated with Gastrografin therapy! It is challenging that you performed in vitro experiment to explain Gastrografin effect in this case study. It might be a first report treated with enteric anisakiasis successfully treated with Gastrografin therapy. However, enteric anisakiasis can generally be treated with conservative treatment. It is questionable that Gastrografin therapy is really necessary treatment for enteric anisakiasis. In addition, it can be uncomfortable treatment for the patients with enteric anisakiasis. There are some comments for revision. Mention about these comments in your discussion.
