Positioning of old and new biologicals and small molecules in the treatment of inflammatory bowel diseases

Jason Reinglas, Lorant Gonczi, Zsuzsanna Kurt, Talat Bessissow, Peter L Lakatos

Abstract

The past decade has brought substantial advances in the management of inflammatory bowel diseases (IBD). The introduction of tumor necrosis factor (TNF) antagonists, evidence for the value of combination therapy, the recognition of targeting lymphocyte trafficking and activation as a viable treatment, and the need for early treatment of high-risk patients are all fundamental concepts for current modern IBD treatment algorithms. In this article, authors review the existing data on approved biologicals and small molecules as well as provide insight on the current positioning of approved
