Direct-acting antivirals and hepatocellular carcinoma in chronic hepatitis C: A few lights and many shadows

Maria Guarino, Anna Sessa, Valentina Cossiga, Federica Morando, Nicola Caporaso, Filomena Morisco; ²⁰ On behalf of the Special Interest Group on "Hepatocellular carcinoma and new anti-HCV therapies" of the Italian Association for the Study of the Liver

Abstract

With the introduction of direct-acting antiviral agents (DAA), the rate of sustained virological response (SVR) in the treatment of hepatitis C virus (HCV) has radically improved to over 95%. Robust scientific evidence supports a beneficial role of SVR after IFN therapy in the progression of cirrhosis, resulting in a decreased incidence of hepatocellular carcinoma (HCC). However, a debate on the impact of DAAs on the
