SPECIFIC COMMENTS TO AUTHORS

This is a research article that investigate the use of an extension of Bayesian Rule Learning (BRL), a model learning algorithm, to explain the input dataset. "Informative structure priors" (i.e., prior knowledge about the dataset) were included in the model

learning process and the degree of incorporation of these structure priors was controlled by a λ hyperparameter. The effect of λ on the operation of the algorithm and the predictive performance was investigated using a simulated dataset and an authentic lung cancer prognostic biomarker dataset. The study is interesting and it may provide new insights about practical considerations in using model learning algorithm for explaining dataset. I have a few more specific comments. (1) Section 2: Is the term “structure priors” commonly used in the field of model learning? More detailed definition and explanation will be beneficial for readers not in the field. (2) Section 2.2.1.3: The methods of model learning using different classifiers were compared in the study. The so-called state-of-the-art classifiers should be described in more detail. (3) Discussion: A key message from the study is that prior knowledge about the dataset can be incorporated into the extension of BRL in model learning to improve the interpretation of the data. How can we assure that this will not introduce bias into the model learning process? (4) Throughout the manuscript, past tense should be used.
