Towards a better understanding of anesthesia emergence mechanisms: Research and clinical implications

Marco Cascella, Sabrina Bimonte, Maria Rosaria Muzio

Abstract

Emergence from anesthesia (AE) is the ending stage of anesthesia featuring the transition from unconsciousness to complete wakefulness and recovery of consciousness (RoC). A wide range of undesirable complications, including coughing, respiratory/cardiovascular events, and mental status changes such as emergence delirium, and delayed RoC may occur during this critical phase. In general anesthesia processes, induction and EA represent a neurobiological example of 'hysteresis'. Indeed, AE mechanisms should not be
