SPECIFIC COMMENTS TO AUTHORS

The study describes a rare case of giant exophytic angiomyolipoma (AML). The authors aimed to share their experience in managing this unusual case. The paper is well written and interesting. The report might attract attention of surgeons and other medical

clinicians. However, there are several points to address/improve. 1. All abbreviations in the abstract and text should be properly introduced and deciphered. 2. The patient BMI is not reported. That is a very important information and should be included. 3. Patient medical history should be extended (if possible, at least self-reported information) as it misses the data about previous infections (self-reported kidney/ bladder infections?), and family history (?). Blood analysis seems quite short. Any successful pregnancies? Children? Etc. 4. Considering reported oophorectomy, the women was in surgical menopause. Did she complained about any relevant menopausal symptoms? Any medication including hormone-replacement therapy? 5. Author did not suggest any causes (even hypothetically) of the observed pathology. 6. Discussion section is quite limited and would benefit from inclusion of any molecular pathology data (suggested pathway to cause the observed AML?) relevant to the hypothetical causes of the observed pathology.

SPECIFIC COMMENTS TO AUTHORS

Overall good case, but needs some minor corrections: - Being a case; clinical photograph of GROSS SPECIMEN should be provided. - Reference number 7. - In references no need to mention MONTHS - HMB-45 stain

SPECIFIC COMMENTS TO AUTHORS

In this case report, the author presented a rare benign tumor, angiomyolipoma (AML), which was preoperatively diagnosed as a retroperitoneal liposarcoma based on an image guided core biopsy. The comments list as follows: 1. As AML is a benign tumor, why

are they removed segmental descending colectomy. Is it essential. 2. Please provide the date of diagnosis, date of surgery, postoperative complications and the prognosis. 3.

Please provide the mass tumor image and the tumor sectional image. 4. if possible, abdominal CT after operation is essential. 5. From the figure 2, it is not a typically HE staining image of lipoma. So SMA staining is essential. 6. There are also some spelling mistakes in the study.
