Current status of PI3K-mTOR inhibition in hormone-receptor positive, HER2-negative breast cancer

Navid Sobhani, Daniele Generali, Marina Bortul, Fabrizio Zanconati, Bruna Scaggiante

Abstract

Breast cancer (BC) is the most common cancer in women and second only to lung cancer in terms of mortality. Among the three different BC subtypes the oestrogen receptor positive (ER+) represents nearly 70% of all cases and it is usually treated with anti-oestrogen drugs. However, the majority of hormone receptor positive (HR+) metastatic
