SPECIFIC COMMENTS TO AUTHORS

The inconclusive findings are not unexpected and use of such terms as 'disappointing' should be deleted.

SPECIFIC COMMENTS TO AUTHORS

Title is apt. Abstract conveys the right impression to the reader. Introduction is satisfactory. Materials and methods are well enlisted and elaborated. Statistical description is very good. Discussion should have contained the different presentations

of cystic duct leakages. This would have made the review more interesting to the reader. It would have also added to the clinical application of the review. Minor changes in the wording is advisable to convey a clear message. Conclusion is well described. References: The referencing is excellent. Reflections: 1. The topic is a very important one which every general surgeon has to be aware of. 2. The review gives a fair per view of literature. 3. The clinical aspects of cystic duct injury should have been discussed. Remedial measures for cystic duct leakages in short would have been of advantage. 4. The conclusion unfortunately could not recommend any technique for prevention.

The authors evaluated 38 studies with 47,491 patients who underwent cholecystectomy. They compared different cystic duct closure techniques: metallic clip, locking clip, ligature and vessel sealing devices. Differences in cystic duct leaks, bile duct injury, and need for second closure technique were minor and did not achieve statistical significance. The pooled cystic duct leakage rate was 0-1% for each of the techniques. Most articles did not differentiate between patients operated for uncomplicated gallstone disease and patients with complicated gallstone disease (defined as patients with cholecystitis, biliary pancreatitis, or patients who underwent preoperative ERCP). Authors' conclusions: Though laparoscopic cholecystectomy is a frequently conducted surgical procedure, good quality evidence from high sample size trials is lacking to determine which cystic duct closure technique is superior with respect to prevention of CDL. Future studies should concentrate on closure techniques in patients undergoing surgery for complicated gallbladder disease, whose risk for cystic duct leakage is high. Reviewers Comments: Thank you for allowing me to review this manuscript. Though a "negative" study, this study is very important since it deals with a very common surgical procedure. The article is well written. The objective of this study is important. The authors reference their methods. The results are presented well. The conclusions are in agreement with the results. The limitations are described. The reference list is extensive. The authors convinced me. Any comment I may have is minor and will not improve this manuscript as is.
