

Comments to Authors

I think this is a well-designed and conducted endoscopic study with interesting results. There are really few studies that addressed endoscopic characterization of esophageal segments. Proposed endoscopic subdivision in three non-symmetrical thirds was really interesting and could be the new standard of longitudinal description of esophageal lesions and procedures. The literature review was adequate. There were minor English errors in the manuscript text. The materials and methods were adequate and coincident to the objective of the study.

Response to the Reviewer

Thank you, we appreciated your comments. Please kindly let us know where in the manuscript are the English errors and we will proceed accordingly.
