**Radiosurgical techniques for the treatment of brain neoplasms: A short review**

Tomaz Velnar, Roman Bosnjak

### Abstract

The radiotherapy has long been used as an adjunct to neurosurgery for treatment of malignant and benign intracranial tumors and other intracranial lesions. Intracranial tumors can be irradiated in three different ways: I) with fractional radiotherapy, II) stereotactic radiotherapy and III) stereotactic radiosurgery, the latter most often by means of a gamma knife or especially designed linear accelerator (Linac). Additionally, the radiosurgery is increasingly used in combination with a systemic therapy in the treatment of metastases.

**Key words:** Neurosurgical techniques; Radiotherapy; Stereotaxy; Gamma knife;
