SPECIFIC COMMENTS TO AUTHORS

Dear Sir, I read with great interest your manuscript and I must congratulate you, as this is a very important topic. However, even your objectives and results are very well presented, there is not a good explanation of why you chose ketamine instead of

phentanyl. Ketamine has a you mention important side effects, but there were others you did not. There are some delay side effects that you did not mention, but you did not mention if you did a follow up of your patients. Also, there were some grammar mistakes you need to correct. Hope to hear from you soon. Sincerely

SPECIFIC COMMENTS TO AUTHORS

- In the introduction I believe that the parentheses part can be excluded - Gastrointestinal endoscopy practices are increasing worldwide. Particularly during colonoscopy, patients do not want to be awake because of severe abdominal pain, cramps and bloating as well

as embarrassment (they feel uncomfortable) - in statistical methods put what is considered as significant in the study - I was struck by the more use of drugs in the nurses group without having any further complications, the explanation was for the longer examination time, so it fits 2 questions. Was the number of participants not insufficient for this type of study? Were the exams done by the same endoscopist? - lower pressures were recorded in the nurses' group, was it necessary to use some drugs to normalize the pressure? - Regarding desaturation, the authors report 4 patients in the group of nurses who had this complication. What measures were needed to normalize saturation? - when authors begin the sentence in the discussion with an author's citation, I recommend placing the citation at the end of each sentence and not after each author's name - cite guidelines after the sentence: In guidelines for propofol administration of non-anesthesia personnel, it has been stated that ASA III and over patient procedures, long complex procedures, and difficult airway conditions require an anaesthetic personnel - with regard to conclusion I do not think it is safe and not proven by the study to say that sedation is safe for use in the 2 groups, since the n of the study is too small for this type of drawing
