SPECIFIC COMMENTS TO AUTHORS

The manuscript is well written, the topic of high interest. Few minor issues like how species appear in text. Escherichia Coli should be coli and this needs to be corrected. Some other species in the text also need to be italicized and we dont need bold typeface

SPECIFIC COMMENTS TO AUTHORS

This is a well-written case report. Although appendicitis and post operative intraabdominal infections are very common, the authors are right that there is not enough literature on intraabdominal infections accompanying ESBL E. coli. I appreciate

SPECIFIC COMMENTS TO AUTHORS

It is an honor to review this valuable article. I think this would be a good written article for reviewing. This is not a rare disease, but the authors write well about the case. I feel authors should remove some sentences in the manuscript, some documentations and

expression seem to be redundant for me. This is a very interesting topic and has not been published so far. There might be worse to be published. But the sentences are too much for the case report. Please refine the sentences. I feel the images should focus on the Figure 1 and I am not sure what this images focus on. The figure 3 and 4 indicated bladder, but I think the anatomical location in the CT is different and I think this “Bladder” is rectum. Please review them. This article is worth to be published, but I feel this need more efforts before being published.

SPECIFIC COMMENTS TO AUTHORS

Authors encountered a case of ESBL producing E. Coli after appendectomy. In the discussion section, authors wrote that ESBL-producing E.coli in acute appendicitis is not so rare. Therefore, this report is not so attractive at this point. Especially, it is hard to

accept a case report in a journal with a impact factor. Readers wants to know how to prevent from encountering a case like yours. Was there any way to prevent from forming abdominal abscess? If it should be discussed. For example, How did the authors close the appendiceal stump? Was there any inflammation around the appendiceal stump at the time of operation? Recent article showed that endoloop are likely to develop more abdominal abscess than endostapler. Was 500 ml of normal saline enough to wash out the bacteria or should you washed the other part of the body? These points will make your report much more attractive.
