SPECIFIC COMMENTS TO AUTHORS

Comments for 42926 A good case report article. Authors presented the 2 typical cases from Giant Anal Condyloma. The treatment of the first was impressive. "Introduction" and "Discussion" were well written. The only shortcomings were several clerical errors,

SPECIFIC COMMENTS TO AUTHORS

This article is a well designed, informative case report. Pictures have good quality. Authors cite 25 appropriate references. I recommend only 2 minor corrections; 1. "Control of glycemia" or "glycemia control" in place of "sugar control" in the treatment

carcinoma should be re-written. The aim of the study at the end of the section is missing. 2. Discussion section should also be re-arranged. The structure of the section is not adequate. 3. Newly published references are missing. 4. Grammatical errors should be corrected. 5. The figures' quality is acceptable. 6. An informative Table should be added.

presentation and management, analysed clinical treatment methods and concluded that a multidisciplinary treatment is necessary when malignant transformation occurs in GCA, for optimal outcomes. Title: It reflects the major topics and contents of the study. Abstract: It gives a clear delineation of the research objective and the results. Cases & Discussion: The case are clearly presented and documented; every cases are elaborated in the discussion section. In conclusion, this is a very interesting report, which provides a reference for clinical treatment of anal carcinoma in Giant Anal Condyloma.

SPECIFIC COMMENTS TO AUTHORS

The authors report two cases of giant anal condyloma with SCC. The cases contrast nicely as one is in an HIV patient and the other is not. Given the rarity of these cases the quality of data is limited to case reports in the literature. The authors do a nice job

of reviewing the literature. I have the following comments and suggestions hopefully to improve the manuscript. 1 Title is appropriate and reflects the main subject of the manuscript. If truly multi-disciplinary authors might want to consider adding a radiation oncologist to discuss radiation fields or a medical oncologist to discuss medical management. 2 Abstract.- no suggestions. 3 Introduction- Brief and to the point. Give appropriate background information for the reader. However, additional information regarding the risk of malignant transformation of a giant anal condyloma to SCC would be important. 4 Case presentation. Nice comparison of HIV and non-HIV associated GCA. Did Case #2 receive systemic chemotherapy? Was an APR considered? why and why not? 5 Discussion. Nice review. Any recommendations on the size/gauge of core needle biopsy? MRI is also an acceptable imaging modality to evaluate the anal sphincter involvement. So MRI or EUS are good options depending on local expertise. The authors did not discuss the role of EGFR-inhibitors, systemic chemotherapy in anal SCC. Could they expand on this. Also could they expand on whether they resect all anal SCC after chemorads or just if residual disease? The goal of this review by the title is a multi-disciplinary discussion of the complex management of GAC but I felt the discussion was mainly surgical. I think expanding the discussion to include what fields are radiated, what chemosensitizers are used, what systemic and local medical options are appropriate would significantly improve the manuscript. 8 Illustrations and tables- Figure1 and 3. Since these are pre- and post therapy of the same patient perhaps clarifying this in the legend or including as Figure 1 A and figure 1B would be beneficial. Figure 2 the images are quite small. anyway they can be expanded for easier review? for Figure 5 and 2 could the authors include the SUV max in the legend. These two cases behaved quite differently would be interesting to know if the SUV max was any different 9 Overall, good review of the literature. Given the rarity of GCA and anal SCC a case report and review of the

literature is sufficient. I would like to see the authors discuss if they manage HIV associated GCA/SCC any differently than non-HIV related. Obviously the outcomes are worse but do they treat differently?
