SPECIFIC COMMENTS TO AUTHORS

This is a high quality manuscript adding novel information regarding the challenging topic of IFND, a borderline lesion associated with difficult diagnosis, prognosis assessment and management. The paper defines the clinical and pathological risk factors

for gastric cancer in patients having their first diagnosis of IFND on pathological report of the endoscopic biopsy specimen. Also, the paper identifies predictive factors for gastric carcinomas associated with poor prognosis (undifferentiated carcinomas, invasive neoplasia) in patients with a first pathological report of IFND and the outcome of lesions with a second diagnosis of IFND at follow-up biopsy. Moreover, the authors offer a guideline proposal for the management of patients with an IFND diagnosis on endoscopic specimen that should include endoscopic resection/ follow-up biopsy within 3-6 month depending on the associated risk factors. This algorithm is improved and more personalized compared to current management of this condition, and it may be implemented globally. The article is enriched with suggestive endoscopic and pathological illustrates that are useful for clinicians.

SPECIFIC COMMENTS TO AUTHORS

This is a well written manuscript on a difficult clinical / diagnostic problem. The cohort of patients studied is impressive in its size and follow up information. However, there are certain aspects that limit the broad applicability of the findings and at very

least these should be addressed in the conclusions (high prevalence of malignancy the population studies). 1. the prevalence of carcinoma is extremely high in this cohort and the authors should address how similar histologic findings in a low prevalence population would need to be interpreted with great caution 2. what is the definition of atypia vs regenerative atypia and how good is the concordance between pathologists to identify these findings 3. would recd to use either the Paris classification or at least the variables considered in this to correlate clinical findings. 4. would separate out IMCA from invasive carcinoma 5. if there is no difference in survival of the early and late diagnosis groups why separate these out
