## SPECIFIC COMMENTS TO AUTHORS

This paper has the purpose of report and discuss a clinical case of modified approach for maxillary sinus augmentation in which innovative methods involving PESS: the combination of platelet-rich fibrin, endoscopic approach, sinus floor elevation, and

simultaneous implant placement were applied for a maxillary sinus floor lift in a 40-year-old patient. The subject is interesting; however, but have some lack of information and the paper has some concerns that need to be reviewed. Introduction Page 4 line 15 "However, the invasion of microorganisms in the oral cavity often led to infections, leading to a high failure rate." Please, provide reference for this information. Page 4 line 28 "PESS (Platelet-rich fibrin + Endoscope + Simultaneous implant placement + Sinus floor elevation) technique is a promising solution in cases with < 4 mm residual alveolar crest height." Please, provide reference for this information. Page 4 line 30 "By combining endoscopic-guided trans-crestal sinus floor elevation with PRF and simultaneous dental implant installation, final prosthesis can be fitted within 3 months, a much shorter period than 12 months if we followed the traditional treatment." Please, provide reference for this information. Page 5 line 8 "To the end, endoscopic-guided trans-crestal sinus floor elevation combined with PRF and simultaneous dental implant installation, followed by final prosthesis within 3 months is a perfect solution for such a situation which needed 12 months of treatment if we followed the traditional ways." This statement is not objective. It seems more a conclusion and should be presented at the end of the manuscript. Discussion Is too short. Researches validating the use PESS, with immediate e 6-month follow-ups must be discussed and compared to the present case. It's important also discuss the others treatments modalities available.
