Abstract

BACKGROUND

The features of Shwachman-Diamond syndrome (SDS) include exocrine pancreatic insufficiency, skeletal abnormalities and bone marrow dysfunction; an often overlooked feature is hepatic involvement.

Hematologic Features. Several groups have reported on the hematologic features of patients with SDS [2–5]. The most common hematologic abnormality affecting 88–100% of patients with SDS is neutropenia, typically defined as a neutrophil count less than $1,500 \times 10^9 /L$. Roughly one-third of patients have chronic neutropenia and the remaining two-thirds have intermittent neutropenia.

Shwachman–Diamond syndrome

Rare Congenital Disorder

Shwachman–Diamond syndrome, or Shwachman–Bodian–Diamond syndrome, is a rare congenital disorder characterized by exocrine pancreatic insufficiency, bone marrow dysfunction, skeletal abnormalities and short stature. After cystic fibrosis, it is the second most common cause of exocrine pancreatic insufficiency in children.
