SPECIFIC COMMENTS TO AUTHORS

"neck of femur fracture", is not really the most common way orthopedic surgeons name medial proximal femoral fractures. I suggest rewording its definition throughout the whole MS. Besides that, it is a proficiently written paper and the topic is somehow of

interest, maybe more to the orthogeriatric specialist, but still deserving a careful reading. I also suggest to change "Common amongst older adults" title section in "Incidence or Prevalence amongst older adults". In addition, the second paragraph of this section is lacking any reference, that I would have loved to see, particularly referring to the "anaesthetic" because in my experience delirium often occurs after surgery and correlation inconsistent, as specified later on in the MS. In the section "Management strategies for delirium", I am not really sure what "outcome" at the end of the first line means: please reword or clarify. In the paragraph "Prophylactic pharmacological therapies have been trialled, but show no efficacy [...]" I feel "show" should be changed to "showed". In the "consent" section, the phrase "In hip fracture the emphasis is slightly different, as the surgery is fundamentally essential, and outcomes worsen as surgery is delayed." is missing a reference: they're not so difficult to find and amongst the many available I recall writing something about it (doi: 10.3928/01477447-20140124-25). In the "Paradox" section reference number 45's DOI does not match the quoted paper and for being a review is quite old. Since available, I suggest citing some more recent literature. As it is not clear whether delirium is a consequence of surgery or anaesthesiology, I feel the latter should be mentioned together with the orthopaedic team in the recommendations and conclusions sections.
