The mortality rate among patients with recurrent disease was 56.3%. CONCLUSION.

Recurrence of hepatocellular carcinoma after liver transplantation is common, and the prognosis is not favorable. The presence of portal venous thrombosis and tumor size greater than 3 cm on baseline CT are significant risk factors.

## Late recurrence of hepatocellular carcinoma after liver transplantation

Norma Arteiro Filgueira

#### Abstract

**1** Liver transplantation is the best treatment option for cirrhotic patients with early-stage hepatocellular carcinoma, but it faces the problem of scarcity of donors and the risk of tumor recurrence, which affects between 15% and 20% of the cases, despite the use of restrictive criteria. The risk of recurrence depends on a number of factors, related to the tumor, the patient, and the treatment, which are discussed in this review. Some of these factors are already well established, such as the histopathological characteristics of the tumor, Alpha-fetoprotein (AFP) levels, and waiting time. Other factors related to the biological behavior of the tumor and treatment should be recognized because

## Hepatocellular carcinoma

A common type of cancer affecting liver

The most common form of liver cancer often seen in people with chronic liver diseases like cirrhosis.

Common (More than 200,000 cases per year in US)

May be preventable by vaccine

Diagnosis often requires lab test or imaging

Treatment from medical professional advised

Can last several months or years

Caused mainly due to the chronic infection of the liver or DNA mutation of the liver cells. Characterized by unexplained weight loss, upper abdominal pain and yellowing of the skin. Treatment options include hepatectomy,
