## **Adult langerhans cell histiocytosis and immunomodulatory drugs: Review and analysis of 34 case reports**

### **Abstract**

Langerhans cell histiocytosis (LCH) is a rare neoplastic disease in dendritic cells. LCH is classified as either a single-system (SS) or multisystem (MS) disease. There is not a standard first-line treatment for LCH in adults. We analyzed the efficacy and safety of immunomodulatory drugs (IMiDs) by searching PubMed/MEDLINE for case reports previously published. The clinical scenarios (neoplastic disease or active disease that

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4951319>

Apr 05, 2016 · Langerhans cell histiocytosis (LCH), characterized by intense and abnormal proliferation of bone marrow-derived histiocytes (Langerhans cells), is a rare disease of unknown pathogenesis, leading to its high rate of misdiagnosis and missed diagnosis. Here we introduce a case of LCH by reviewing related literatures and focus on the clinical manifestations, histopathologic ...

<https://bmcrenotes.biomedcentral.com/articles/10.1186/s13104-015-1799-z>

Jan 09, 2016 · Langerhans cell histiocytosis (LCH) is a disease caused by the accumulation and proliferation of abnormal bone marrow-derived Langerhans cells. These dendritic cells, lymphocytes, eosinophils and non-dendritic histiocytes form the typical infiltrates of LCH. These cells may be found at different degrees in several organs [1].

## Langerhans cell histiocytosis

Rare Cancer

Langerhans cell histiocytosis is a rare cancer involving clonal proliferation of Langerhans cells, abnormal cells deriving from bone marrow and capable of migrating from skin to lymph nodes. Symptoms range from isolated bone lesions to multisystem disease. LCH is part of a group of syndromes called histiocytoses, which are characterized by an abnormal proliferation of histiocytes. These diseases are related to other forms of abnormal proliferation of white blood cells, such as leukemias and lymphomas.
