SPECIFIC COMMENTS TO AUTHORS

The study is aiming to identify the possible risk factors contributing to anxiety in gynecological cancer patients. There are many grammer and expression errors. Some parts of the manuscript are hard to understand and dull. There are unexpected expressions.

For example "no family patients" Whole manuscript should be reviewed by a native English speaking person. I have some concern about statistics. Because the sample size is small, how was the distribution of the parameters. For non-normally distributed parameters Mann Whitney Test would be appreciated. And, why did not the authors use paired t test or Wilcoxon test for pre-after comparison. Despite the minor problems, the study has some value for publication following a revision. Yours Sincerely.
