SPECIFIC COMMENTS TO AUTHORS

An interesting paper about a pseudoaneurysm between duodenum and pancreas after an episode of acute cholecystitis treated with cholecystostomy. It emphasizes the importance of being aware of psuedoaneurysms as a possible cause of gastrointestinal

bleedings. Can the authors explain how the pseudoaneurysm developed despite the absence of an inflammatory process in the close vicinity of pancreas or duodenum? I do not understand how an acute cholecystitis (at least if it was not associated with pronounced local inflammation) or the cholecystostomy could affect the pancreaticoduodenal artery. Could there have been a concomitant acute pancreatitis, or an episode of pancreatitis in the interval between the episode of acute cholecystitis and second admission?
