

Overlay of a sponge soaked with ropivacaine and multipoint infiltration analgesia result in faster recovery after laparoscopic hepatectomy

Abstract.

BACKGROUND

Compared with traditional open surgery, laparoscopic surgery is preferred with less trauma, less pain and faster recovery. Nevertheless, many patients still suffer from postoperative pain resulting from the surgical incision and associated tissue injury. Many researchers have reported methods to improve postoperative pain control but there is not a simple and effective method that can be clinically adopted in a widespread manner. We designed the study to prove the hypothesis that application of ropivacaine in the port site and operative site in patients is an effective and convenient method which can

Postpartum Care After the first 24 hours, postpartum recovery is rapid. A regular diet can be offered to most women as soon as they request food, sometimes shortly after delivery. Because of their risk to require general anesthesia, it is prudent to delay feeding women who have experienced, or are at risk for, significant postpartum hemorrhage.
