Sexual health and fertility for individuals with inflammatory bowel disease

Leenhardt R *et al.* Sexual health and fertility in IBD patients

Romain Leenhardt, Pauline Rivière, Patrick Papazian, Isabelle Nion-Larmurier, Guillaume Girard, David Laharie, Philippe Marteau

Abstract

The impact of a chronic disease such as inflammatory bowel disease (IBD) on sexual functioning and body image can significantly impair the quality of life of patients. This review considers the sexual and fertility aspects of IBD patients and their daily management. Modern IBD healthcare management should include appropriate communication on sexuality and consider psychological, physiological, and biological issues. Patients with IBD have less children than the general population, and voluntary childlessness is frequent. The most influential factors reported by IBD patients who experience fertility alteration are psychological and surgery-related problems. Pregnancy is a major concern for patients, and any pregnancy for IBD patients should be closely followed-up to keep the chronic disease in a quiescent state. Preconceptional consultation is of great help.

Fertility and Contraception in Women With Inflammatory ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4865770>

Inflammatory bowel disease (IBD) carries a high burden in women during their reproductive years, and family planning issues are often a significant cause of concern. Fertility is normal in women with nonsurgically treated ulcerative colitis and similar or slightly reduced in women with Crohn's disease.

Inflammatory bowel disease (IBD) including both ulcerative colitis and Crohn's disease is increasing worldwide. Although diagnosis is equally found in men and women, the chronicity of IBD poses a unique impact on the milestones of a woman's life. As the gastroenterologist becomes increasingly important in the health maintenance of patients with IBD, this review stresses the unique gender ...

Inflammatory Bowel Disease

Medical Condition

Image for Condition

A group of intestinal disorders that cause inflammation of the digestive tract.

- Common (More than 200,000 cases per year in US)
- Often requires lab test or imaging
- Treatments can help manage condition, no known cure
- Can be lifelong

IBD is said to be the result of autoimmune reactions. Inflammatory bowel disease (IBD) presents as Crohn's disease or ulcerative colitis. It may be characterized by diarrhea, abdominal pain and cramping, tiredness, and weight loss. Anti-inflammatory drugs play an important role in the treatment. Surgery is sometimes performed.

Symptoms

Symptoms may vary from mild to severe and include:

- Diarrhea
- Fever
- Fatigue
- Blood in stool
- Bleeding ulcers
- Stomach pain
