This is a very interesting case report on SLE in combination with severe preeclampsia-eclampsia. The case is indeed interesting and well presented, introduction and discussion are written appropriately giving clear messages. The main issue with this case is actually the clinical management. It seems that there was a big delay on proper diagnosis and treatment of the severe preeclampsia which in the end became eclampsia and fetus demise was the outcome. Patient should have been delivered from the 2nd day according to the results presented. On the third day when eclampsia occurred why was MGSO4 not administered and why the patient didn't have an immediate delivery? Also it is not clear when and why all these time consuming blood tests on antibodies took place actually. Authors should also add some information regarding follow up of the patient before admission and in addition some details about ultrasound findings on the fetus, percentile of growth, Doppler studies, and amniotic fluid. What do the authors mean as close monitoring of the patient and fetus? Add please some more details which can be useful for future reference, as despite the efforts there was a bad perinatal outcome. English language is simple and easy to understand but some polishing is actually needed.
