Predicting mortality in patients with in-hospital ...

<https://www.sciencedirect.com/science/article/abs/pii/S0016510713024401>

The mortality rate in patients with in-hospital bleeding was significantly higher than that in outpatients (8.9% vs 3.8%; odds ratio [OR] 2.44; 95% confidence interval [CI], 1.57-3.79; $P < .0001$). Hemodynamic instability on presentation (OR 7.31; 95% CI, 2.71-19.65) and the presence of severe comorbidity (OR 6.72; 95% CI, 1.87-24.0) were the strongest predictors of death for in-hospital bleeders.

Predictors of Rebleeding and Mortality in Patients with ...

<https://link.springer.com/article/10.1007/s10620-009-1093-9> ▾

Jan 22, 2010 - The only independent predictor of mortality in our study was in-hospital bleeding (OR 8.3), which is in concordance with a previous report [1, 3]. The mortality rate was 16.3% in patients with in-hospital bleeding in this study, and this high mortality rate is in line with data from Europe and North America [1, 3].

ployed to identify independent predictors of in-hospital mortality. Results: 1,067 patients were included, 65% male with a mean age of 58.8 years. Mean number of comorbidities per patient was 1.6 ± 0.76 . The most frequent cause of bleeding were gastric and duodenal ulcers (55.4%); 278 patients (25.8%) recei-
