First: this work is in my opinion original because the serious infections of the oral cavity are probably not very common at least in western countries and in immunosuppressed patients (eg oncology). It would probably be useful to know if there are epidemiological data on these infections, for example in immunosuppressed or immunocompromised even if this case did not present any comorbidity. Second: The importance of the manuscript lies in the singularity of the case. Serious dental infections are probably the order of the day for dentists and for maxillofacial surgeons but must also be carefully evaluated by general clinicians, Third: an important observation is that the authors do not describe whether they have performed blood culture and / or culture from the abscess. In the management of a similar case, even if it had a very fast trend, such assessments should have been made and described
