

Name of journal: World Journal of Clinical Cases

Manuscript NO: 50758

Title: A case report of the diagnosis of Laron Syndrome using monoplex-PCR technology with a whole-genome amplification template

Dear editor and reviewers:

We thank you for your review and your time, and here is the answer to the comments:

1. Commentary: Generally, the manuscript is interesting from the scientific and practical points of view. It is well presented and covered efficiently all aspects related to scientific work writing. The only pitfall is the presence of multiple linguistic and editing mistakes that need urgent revision and correction. Some of these editing errors are shown in the attached file.

Suggested action: Minor language polishing

We had considered all corrections made to the manuscript and accepted them when pertinent. We also got an English Polishing. Dr. Leonardo M. Porchia, Ph.D., who helped prepare this manuscript, and did review the final manuscript version. Dr. Porchia is a native speaker, an American, and has lived in the United States of American from birth to 35-years of age and studied at American schools. Dr. Porchia had not fulfilled the requirements for authorship and accordingly was placed into the Acknowledgements section. He does not have the ability to provide evidence of proofreading, as he is not a service; therefore, we hope we are not required to provide this evidence as he was in charge of writing this paper. Please, take this into consideration. Thank you for your time.

Sincerely,

Professor Esther López Bayghen
