This is nicely illustrated and clearly classifies an important anatomical variant which has special importance for Upper GI surgery, Pancreaticobiliary disease, Radiology and Interventional radiology. The population is significant size and the paper will become an important reference

The retrospective study summarizes good angiographic data determining a new proposal classifying the celiomesenteric trunk. Embryological and developmental mechanisms are discussed as the driving processes. Comments 1. The clinical implications should be given more clearly. In Table 1 a separate lane should be included summarizes the clinical facts. 2. Is there any data that a special trunk type is preferentially affected by arteriosclerosis?

I think that the topic of manuscript is not really suitable to this journal (WJG). Indeed, if there are clinical implications, this are only related to surgical issues. Therefore, a surgical or a radiology journal would be a much better choice. Indeed, as stated by the authors themselves, the "Knowledge about the spectrum of CMT variations is important for planning surgical or interventional procedures in the upper abdomen", which confirms the absent clinical implication for gastroenterologists. The English language should be improved.

Dear author I m an abdominal surgeon and I appreciate very much the content of your article, it is interesting and well written. As you wrote in the conclusions the limitation of the investigation is that you "have not assessed the effect of using the proposed classification system on interventional and surgical procedures", it could be done in the next future.
