Case Control Study

MicroRNA signature in patients with hepatocellular carcinoma associated with type 2 diabetes

Abstract

BACKGROUND

Nonalcoholic steatohepatitis-related cirrhosis is one of the liver complications in type 2 diabetes mellitus (T2DM) and reported to be a risk factor for developing hepatocellular carcinoma (HCC). A reliable screening biomarker of liver cirrhosis (LC)

Serum Circulating microRNA Profiling for Identification of ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3817315>

Patients and Methods. Thirteen patients with type 2 diabetes, 20 obese patients, 16 obese patients with type 2 diabetes and 20 healthy controls were selected for this study. MiRNA PCR panels were employed to screen serum levels of 739 miRNAs in pooled samples from these four groups.

Identification of a novel microRNA signature associated ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4344737>

Identification of novel 3-miRNA signature associated with survival in ICC. Survival analysis showed that the patients in the low-risk group had 1- and 2-year survival rates of 88.1% and 57.4%, respectively, while the patients in the high-risk group had 1- and 2-year survival rates of ...
