

Bouveret syndrome: A case report

Fei Wang, Zhi-Qiang Du, Yi-Lan Chen, Tian-Ming Chen, Yue Wang,
Xiang-Rong Zhou

Abstract

BACKGROUND

Bouveret syndrome is a rare complication of cholelithiasis with only 315 cases reported in the literature between 1967 and 2016. Delay in diagnosis is associated with a high mortality rate. Diagnosis is based upon clinical manifestations, gastroscopy, and imaging studies such as abdominal computed tomography and magnetic resonance cholangiopancreatography. Endoscopic stone extraction or lithotripsy is the preferred choice for treatment as it is safe and minimally invasive with few complications. However, if endoscopy fails, surgery is required.

Bouveret's syndrome, described by Léon Bouveret in 1896 (1), represents gastric obstruction secondary to an intra-luminal gallstone from a cholecystoenteric fistula (2). In an elderly patient presenting with acute gastric outlet obstruction (GOO) the working differential diagnosis is extensive (table 1).
