SPECIFIC COMMENTS TO AUTHORS

Acute ischemic stroke is one of the most common strokes that occur in the clinical practice. Studies show that intravenous thrombolysis is the most commonly used reperfusion therapy for stroke, and early application of the thrombolytic agent, recombinant tissue plasminogen activation, is safe and effective in patients within 4.5 h after the onset of acute ischemic stroke. In this study, the authors analyzed the relationship between Hcy level and the prognosis of elderly patients with AIS after the administration of recombinant tissue plasminogen activation. Overall, this study is well designed, the results are interesting. Comments:1. Some minor language editing is required. 2. The references are updated, and well discussed with the results. 3. The tables is OK. I suggest to accept it for publication after a minor revision.

Answer: Thank you for your comments. The language of the manuscript has been proofed again. And the minor spelling mistakes were corrected.

SPECIFIC COMMENTS TO AUTHORS

Thank you for inviting me to review this interesting study. This is a well designed study with interesting results. Only the discussion seems somewhat long, if the authors can shorten it, it will be more interesting. Thank you very much.

Answer: Thank you for your comments. The discussion has been shorten.
