Abstract

BACKGROUND

¹Music seems to be beneficial in multiple clinical areas. Colonoscopy is a stressful event for patients, especially with conscious sedation. Music during colonoscopy has been evaluated in multiple randomized controlled trials (RCTs) with varied results. Even meta-analyses on the subject over the years have yielded inconsistent conclusions. Therefore, we conducted an up-to-date meta-analysis regarding music during colonoscopy.

AIM

To assess the effects of music played during colonoscopy on patients' perspectives and sedation requirements.

METHODS

Multiple large databases were aggressively searched (November 2018). RCTs comparing
