Dear authors: The cases are very interesting but I have some concerns. I think that perhaps could be better to write cases separately because is very different to read the data of both cases together. I think that there is a cronological phase that is not complete. from radiology to pathology is surgery but no information about technical aspects, surical findings, type of hepatectomy, morbidity and so on. No information about adjuvant therapy The data of previous cases should be like a PRISMA study, databases, years, languages, restrictions, MesH, ... Possibly the search is perfect but is mandatory to include this information. PD: I think that as you said liver abscess was a very low diagnostic possibility, satellitosis, no fever, CRP normal, ... So all the comments about diagnosis as liver abscess should be erased

Comments, 1. The part of patient data was not well written. The part of the case presentation should be re-write. The author should described the patient data in the better way as the following, - Case 1: • History • Physical examination • Laboratory data • Imaging • management - Case 2: 2. The laboratory data is not sufficient. What about the CBC? WBC? 3. Did you test the serum procalcitonin? If so, how about the procalcitonin value? Currently, procalcitonin would be the good predictor for infection. 4. What is the rationale for the liver biopsy of the first patient? 5. I think the Figure 3 would be MRI. The author should carefully review this point. 6. The most likely diagnosis from the MRI findings from the second patient would be cholangiocarcinoma rather than liver abscess. The T2 phase, the lesion is not clearly bright. The second case should not be the mimicking lesion. The author should be re-review with radiologists. 7. Did the patients perform the distant metastasis work up? CT chest or PET CT? 8. The patients underwent hepatectomy. The author should describe more data of the operation. Intraoperative findings? Anatomical or anatomical resection? Lymphadenectomy? 9. How about the short term outcomes? Complications? 10. The table 1 was not clearly data from previously report case. The format of the data is not easy for reader to understand. The summary table should re-write. The author should show the data from each previous report cases. 11. Due to the dismal prognosis of this kind of cancer. What is your recommendation if the patient was preoperatively diagnosis as SICC? 12. What is the new findings from this report?
