Hyalinizing clear cell carcinoma: A rare entity

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3227265>

Hyalinizing clear cell carcinoma (HCCC) is an uncommon malignant salivary gland tumor accounting for about 1% of all intra-oral salivary gland tumors. Microscopic diagnosis of clear cell carcinoma may be challenging because of the spectrum of features which frequently overlaps with the other salivary gland tumors that contain clear cells, and thus it may be a diagnosis of exclusion.

Hyalinizing Clear Cell Carcinoma of the Tonsil: A Case Report

<https://link.springer.com/article/10.1007/s12105-017-0822-1> ▾

May 16, 2017 · Hyalinizing clear cell carcinoma is a rare tumor of the oral cavity and is even more rarely located in the tonsil. Here, we present a case report of a pedunculated tonsillar mass in a nearly asymptomatic patient that was present for 2 years prior to removal. Complete surgical excision was achieved and no adjuvant therapy was recommended.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2811632>

Jul 05, 2009 - Hyalinizing clear cell carcinoma (HCCC) is a **rare** neoplasm of salivary gland origin. Although previous cases had been mentioned in the literature, it wasn't until 1994 Milchgrub et al. described it as a distinct **entity**. In their initial **case** series, they described 11 cases with a female preponderance that arose **in the oral cavity**.
