in the progress of influenza-associated programming death in a four-year-old child. This manuscript is interesting, and only few concerns needed to be addressed as follows. 1. The title of this manuscript could be more clear cut to described its content. 2. In Auxiliary examination section, the authors demonstrated that the blood ALT, AST...were higher than flu survivor. Is there any reference to show the average detection of ALT, AST....for flu survivor? 3. In Final Diagnosis section, please correct this sentence to full sentence. 4. In Biochemical tests, the creatinine kinase and creatinine kinase MB were much higher. Please discuss this point.
