This manuscript from authors have demonstrated the progress of Pediatric living donor liver transplantation and its good outcomes over one decade in Shanghai. The language of the manuscript is well written. It would be a good addition to the exsiting literature highlighting progress of PLDLT in Shanghai.

This is an overview about the pediatric transplantation and their development in Shanghai. However, there are no new informations how to deal in this subspecialty in transplantation. It is only a description of the program. Not more. I do not recommend the publication in WJG.

The manuscript describes the review of authors' own data of pediatric living donor liver transplantation in high volume center in Shanghai and concluded that PELD score, operation duration, and ICU length of stay were independent predictive factors of 1-year and 3-year patient survival. Since case number and analysis are satisfactory and the results in China is worthwhile, the manuscript deserves publication in World Journal of Gastroenterology. Minor comments: I suggested in the attached file. Especially, use of abbreviation should be reconsidered for the convenience of readers.

## SPECIFIC COMMENTS TO AUTHORS

Dear authors, thank you for submitting your paper to the World Journal of Gastroenterology, it is certainly an interesting topic that will be valuable to the transplant community. However, there are few comments I like to include in my review and here are they; 1- The title of the paper is very confusing and does not reflect the topic or the contents of the paper, it reads like you are studying the donor population and not the recipients. I think you may consider correcting it to something like this: Pediatric live-donor liver transplant recipients, decade progress in Shanghai: characters and risk factors of mortality. 2- There are few paragraphs that hard to understand due to the way there were written, that includes the results section, I suggest consulting with an academic secretary with advanced experience with the English language. 3- In the discussion section you mentioned the following; (The ICU management technique plays an important role in liver transplant. Prolonged ICU length of stay is associated with increased hospital mortality, and impaired patient and graft survival after liver transplantation), I have few questions about this statement and actually the results of the study regarding ICU stay and outcomes. A. Do you think that the ICU admission and length of the stay and/or ICU management that led to the poor outcomes? Or simply that the patients who required prolonged ICU care were sicker and/or had complicated intra-operative course that resulted in prolongation of their ICU stay? B. Can you look at the group that spent more ICU time and compare their pre-operative data and intraoperative data to the group who spent less time in the ICU? I think that will answer this question. C. How the ICU care have changed over the course of the years that you looked at in your study. Overall, it is a well-written and well-conducted study.
